Specification notes:

1. Only min. values are controlled and guaranteed, max. values are for reference only. Span is the algebraic difference between the output voltage at full scale pressure and the output at zero pressure. Full scale span is ratiometric to the supply current.
2. Non-linearity is based on **Best fit Straight Line** from the zero to the full scale pressure. Hysteresis is the maximum output difference at any point within the operating pressure range for increasing and decreasing pressure.
3. All specifications shown are relative to 25 °C.
4. Long term stability over 1 year.
5. The maximum pressure that can be applied without changing the transducer's performance or accuracy.
6. The maximum pressure that can be applied to a transducer without rupture of either the sensing element or transducer case.
